CYBERTRAP

THREATIQ LOCAL

Discovery Layer

FROM RAW DATA TO PRIORITIZED THREAT INSIGHT

CyberTrap ThreatIQ transforms internal telemetry and global threat intelligence into focused, actionable insights. By combining real-time behavior analysis with vulnerability context and dark web monitoring, it empowers your SOC to detect, prioritize, and respond with precision.

CYBERTRAP

THREATIQ LOCAL

Discovery Layer

CyberTrap ThreatIQ strengthens your security posture by turning raw signals into operational clarity. It correlates adversary behavior within your network with known external threats, surfacing only the most relevant intelligence. This allows security teams to act decisively—focusing on what truly matters.

The Adversary Skill Assessment module continuously analyzes attacker behavior, tactics, and decision-making patterns to determine intent and capability. This real-time profiling informs both the depth of engagement and the urgency of response.

The CVE Analysis Engine enhances this picture by linking current asset configurations with emerging CVEs and known exploits, highlighting exactly where your exposure is greatest—before it's targeted.

THREATIQ

In parallel, the Darkweb Intelligence module scans hidden forums, marketplaces, and paste sites for stolen credentials, malicious tools, and chatter related to your brand or infrastructure. This early-warning layer provides external context to internal events, closing the loop between detection and threat validation.

USER BENEFITS:

- Real-time profiling of attacker skill and intent to prioritize response
- Continuous correlation of internal assets with emerging vulnerabilities
- Dark web visibility for early detection of leaked credentials and brand targeting
- Context-rich threat intelligence that drives faster, more informed decision-making
